

CLAIMS

1. (currently amended): A shoulder strap carrying system comprising at least a one-shoulder carrier for carrying ~~of~~ hooked objects, comprising:

5 a) at least one generally rectangular strap having only two ends and having a face for engaging with one shoulder of a user, wherein each strap end is a terminal end said strap being sufficiently short to stay within a shoulder zone of the one shoulder of the user, said strap configured for lying freely on the one shoulder of the user and for both said strap ends to
10 simultaneously support a same ~~item~~ items;

 b) a first ~~two~~ ring-shaped securing means provided respectively only at said ~~two~~ ends of said strap;

 c) at least two elongated flexible connector means each having a first end and a second end, said first ends of said at least two connector means
15 respectively engaging said first ring-shaped securing means;

 said at least two connector means being narrower than said strap and comprising means for engaging the items to be carried, whereby said items can be hung for carrying;

wherein said means for engaging comprise anchor shaped elements
20 having at least two hooks.

whereby it is possible to carry said item hanging on one hook of each anchor element while other hooks usable for additional scopes

~~whereby it is possible to connect two of said carriers and to obtain a two-shoulder carrier.~~

25

2. (canceled).

3. (currently amended): The shoulder strap carrying system according to claim 2 ~~1~~ further comprising a lower transversal element, ~~said second ends of said two elongated flexible connector means being connected by means of~~
30 ~~said transversal element, connecting the second ends of the two elongated flexible connector means by engaging another of the hooks on each anchor element~~

 wherein said user can hand-manuever said transversal element and stabilize said items thereby preventing said generally rectangular strap
35 from sliding down from said shoulder.

4. (original): The shoulder strap carrying system according to claim 3 wherein said transversal element is a belt element.

5. (canceled).

6. (canceled).

5 7. (original): The shoulder strap carrying system of claim 1 further comprising a second identical one-shoulder carrier and at least one upper transversal element for connection of the shoulder strap of said shoulder carrier to the shoulder strap of said second shoulder carrier.

8. (canceled).

10 9. (canceled).

10. (original): The shoulder strap carrying system of claim 1 further comprising a length-adjusting apparatus located on each of said elongated flexible connector means.

11. (new): The shoulder strap carrying system of claim 3 further comprising a length-adjusting apparatus located on each of said elongated flexible connector means.

12. (new): The shoulder strap carrying system of claim 4 further comprising a length-adjusting apparatus located on each of said elongated flexible connector means.

20 13. (new): The shoulder strap carrying system of claim 7 further comprising a length-adjusting apparatus located on each of said elongated flexible connector means.

25 14. (new, but obtained by amending old claim 1 in different way): A shoulder strap carrying system particularly useful for the carrying of plastic bags comprising at least a one-shoulder carrier for carrying of hooked objects, comprising said shoulder carrier consisting of:

30 a) ~~at least~~ one generally rectangular strap having only two ends and having a face for engaging with one shoulder of a user, wherein each strap end is a terminal end said strap being sufficiently short to stay within a shoulder zone of the one shoulder of the user, said strap configured for lying freely on the one shoulder of the user and for both said strap ends to simultaneously support a same item;

35 b) a first ~~two~~ ring-shaped securing means provided respectively only at said ~~two~~ ends of said strap;

c) two elongated flexible connector means being narrower than said strap each having a first end and a second end, said first ends of said at least two

connector means, respectively engaging said first ring-shaped securing means:

d) two hooks, each located at second end of each of said two connector means connected to a hook whereby items to be carried are hooked in two points and are prevented from dangling

15. (new) The shoulder strap carrying system of claim 14 further comprising a lower transversal element having two ring shaped endings, each connected to one of said two hooks,

whereby each of said two hooks can connect thus one of said endings, thus a point of a carried item; whereby said lower element can be hold by a user for a more comfortable transportation

16. (new): The shoulder strap carrying system of claim 14 further comprising a second identical one-shoulder carrier and at least one upper transversal element for connection of the shoulder strap of said shoulder carrier to the shoulder strap of said second shoulder carrier.

17. (new): The shoulder strap carrying system of claim 15 further comprising a second identical one-shoulder carrier and at least one upper transversal element for connection of the shoulder strap of said shoulder carrier to the shoulder strap of said second shoulder carrier.

18. (new) A shoulder strap carrying system for carrying hooked objects, comprising:

a) generally rectangular, one shoulder, carrier strap having only two ends and having a face for engaging with one shoulder of a user, wherein each strap end is a terminal end and said strap is uninterrupted from end to end, said strap being sufficiently short to stay within a shoulder zone of only one shoulder of the user, said strap configured for lying freely on the shoulder of the user, and for both said strap ends to simultaneously support a single item;

b) a first ring-shaped securing means provided respectively only at each of said ends of said strap;

c) at least two elongated flexible connector means each having a first end and a second end, said first ends of said at least two connector means respectively engaging said first securing means;

said at least two connector means being narrower than said strap and comprising means for engaging the item, whereby said items can be hung for carrying;

said system further comprising a transversal element connecting the second ends of the two elongated flexible connector means, whereby the user

13

can hand maneuver said transversal element to stabilize the item thereby preventing the strap from sliding down said shoulder;

wherein said means for engaging comprise anchor shaped elements having at least two hooks, said item hanging on one hook of each anchor element and said transversal element engaging another of the hooks on each
5 anchor element.

19. (new): The shoulder strap carrying system of claim 18 further comprising a second identical one-shoulder carrier and at least one upper transversal element for connection of the shoulder strap of said shoulder
10 carrier to the shoulder strap of said second shoulder carrier.
